23.

Two dates frame the entire case

The claim is about timing and proximity—not a forecast of the path in between.

The reference existed before the observed test.

The test landed 98.34 points below the reference level

The gap equals 0.42% of the published downside level.

$$23,329.74 - 23,231.40 = 98.34$$

0.42%

below the reference level

**Close in scale,
but not identical.**

This distinction keeps the case precise and auditable.

This is evidence of one documented case—not a prediction

A useful case study separates what the record supports from what it cannot establish.

WHAT THE RECORD SHOWS

- 01 A reference level was posted before the market low.
- 02 The observed low was 98.34 points lower.
- 03 The interval was reported as 16 trading sessions.

WHAT IT DOES NOT SHOW

It does not prove future predictive power.

It does not describe the full price path.

It is not a recommendation to trade.

QIM projections are structural and non-predictive.

The value is an auditable reference point
